(It takes a colony of three to four thousand mealworms a week to digest a coffee cup.)

"Shall I refill your water glasses so that they're ful

systems that would feed plastic waste to mealworms on an industrial scale, but he grapples with the ethical and practical problems in doing so. (It takes a colony of three to four thousand mealworms a week to digest a coffee cup.) "It's very capitalistic or, like, it's a very human way of thinking," Hedström said. It doesn't feel like symbiosis if one of you is being farmed. Mealworms are the larvae of Tenebrio molitor, a species of darkling beetle, which is sensitive to light. As part of the exhibition, Hedström and his collaborators had attempted to use lighting to direct the worms to consume the Styrofoam in certain patterns. But it wasn't working very well.
